

Leg Boots

Reduce Emissions from Floating Roof Support Legs

Mesa Leg Boots (socks) are designed to reduce emissions and product loss caused by vapors escaping from floating roof support legs.

Mesa Leg Boots are designed with MesaThane™ 6036 urethane seal material to form a covering for the support legs. (Mesalon 7010 is available for specialty applications). The Leg Boot provides excellent chemical resistance against products in the tank while resisting the harshest environmental conditions outside the tank.

Mesa Leg Boots provide an industry proven vapor reduction solution by offering the following features:

- Interior resists 100% aromatics, neat M.T.B.E. and gasohol vapors
- Exterior resists U/V, water and ozone effects from outside tank
- Easily installed while tank is in-service
- Significantly reduces vapor emissions from floating roof support legs
- Factory welded R/F seams provide durability
- Standard sizes, configurations and custom designs available
- Most economical and efficient vapor reduction solution
- In addition to emission reduction, Mesa Leg Boots helps prevent corrosion by preventing rain water from entering and collecting in the floating roof support leg.

Shown: Mesa Leg Boot installed on roof leg with "U-Type" leg handle (adjacent to uncovered leg for reference). Leg Boots are designed for both "T-Bar" and "U-Type" handles.

Leg Boot ID is determined by handle type, pin length and Leg Sleeve OD. Mesa Rubber Company designs Leg Boots according to specifications stated on the Data Sheet, which is completed by the customer.

Consult Mesa Rubber Company **Chart A** for chemical compatibility.
